Design and Implementation of a

Database Management System for Hospital Appointment and Patient Care Management

A reliable foundation for efficient operations and better patient outcomes

PROBLEM STATEMENT

Managing hospital **appointments** and **patient care** is increasingly complex

Manual records cause **errors, delays**, and fragmented information

A **reliable, scalable** database system is essential for **efficient operations** and better **patient outcomes**

PROPOSED APPROACH

01 Build a centralized relational database management system

02 Integrate appointment scheduling and patient care modules

03 Design a normalized schema to eliminate data redundancy

04 Implement role-based access for staff, doctors, and patients

05 Ensure data integrity, security, and reliable operations
